Context

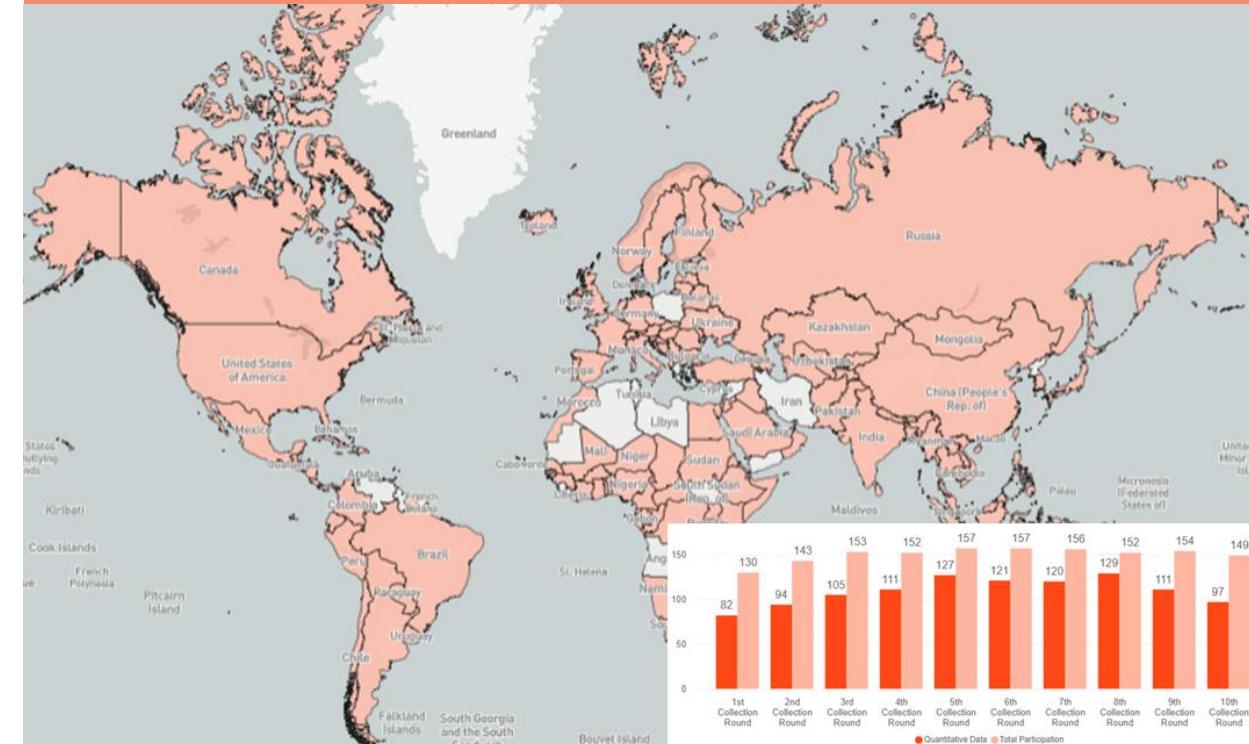

What is ANIMUSE Global Database?

Stands for ANImal antiMicrobial USE (ANIMUSE) Global Databse.

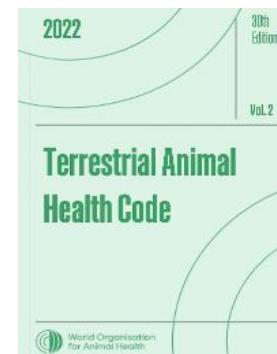

In 2015 WOAH launched the data call to all its Members to provide AMU data in annual basis (every September with a deadline for December on the same year).

Based on WOAH Standards

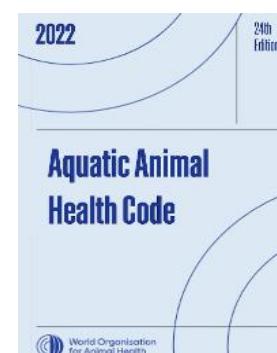

ANIMUSE Global Database

AMU Questionnaire based on WOAH International Standards for AMR

Ch.6.9. **Monitoring of the quantities and usage patterns** of antimicrobial agents used in food-producing animals

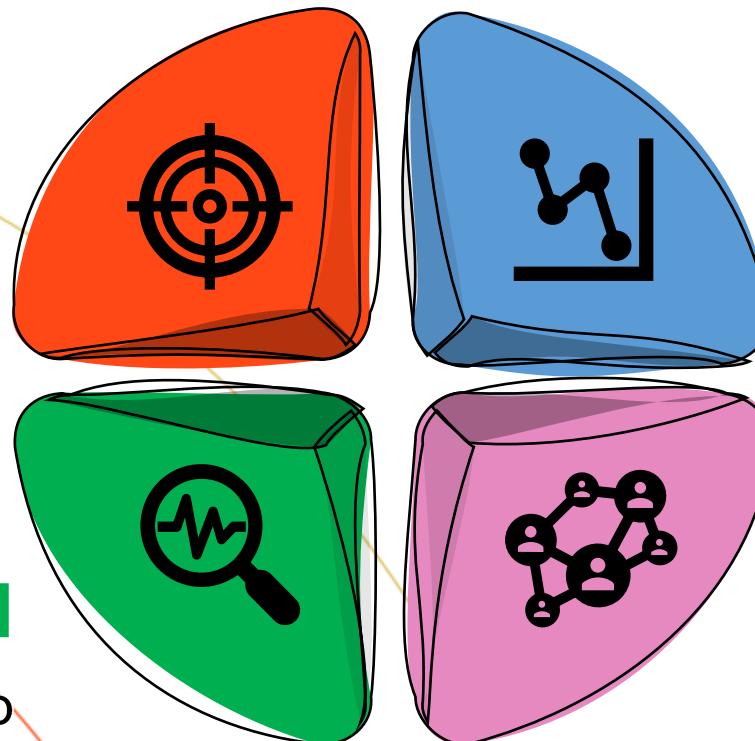

Ch.6.3. **Monitoring of the quantities and usage patterns** of antimicrobial agents used in aquatic animals

INTERPRETATION

Helping in the interpretation of **AMR surveillance data** and assisting in responding to problems of antimicrobial resistance in a precise and targeted way

EVALUATION

Assisting in risk management to evaluate the **effectiveness** of efforts and mitigation strategies.

EVOLUTION

Giving an **indication of trends** in the use of antimicrobial agents in animals over time and **potential associations with AMR** in animals

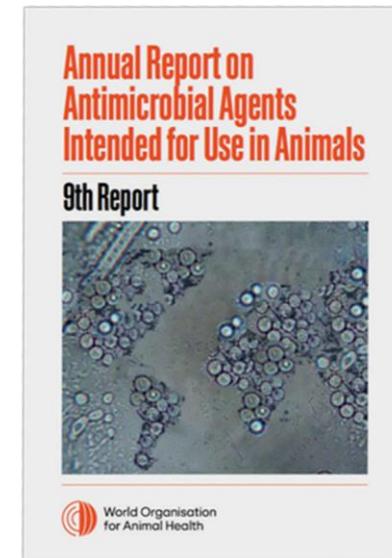

COMMUNICATION

Ensuring **transparency** and communicating on the **risks** (if data published)

Interactive Report: Only selected charts – Based on most updated data in ANIMUSE (automatic refresh every hour).

PDF Version: All analysis based on a data extraction from November 2024

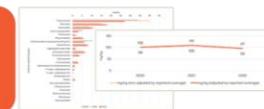

Results of the Ninth Round (157 Participants)

2022 Analysis of Antimicrobial Quantities (107 Participants)

Trends from 2020 to 2022 (85 Participants)

Published in May 2025

KEY FIGURES

In short

Global antimicrobial use is decreasing

Non-responsible practices remain

Transparency on AMU is improving

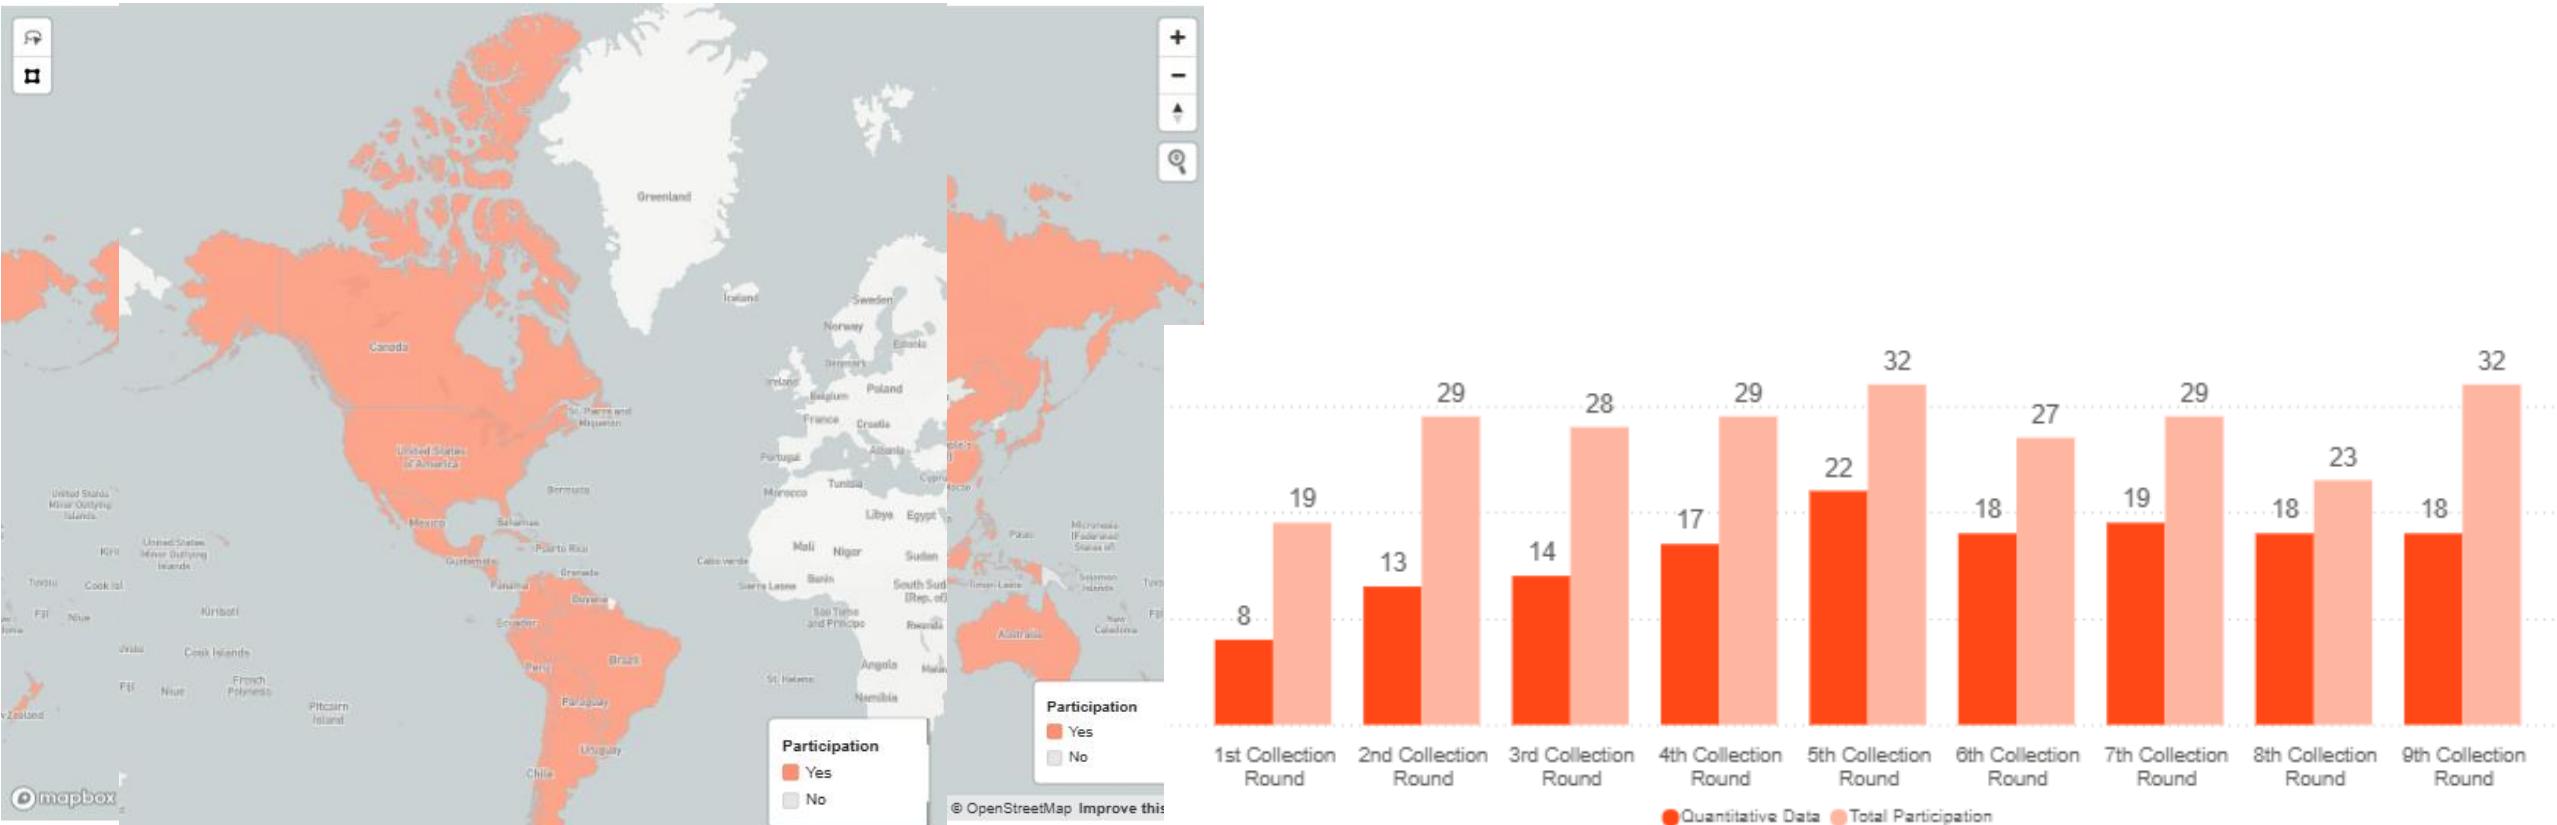

Global Participation in ANIMUSE – 9th Round

7

The overall participation rate in the current ninth data collection round has slightly changed over time, despite all the resilience challenges and competing priorities WOAH Members have to face. **Three out of five submitted reports contain quantitative data**, representing a decrease in countries providing AMU reports, this could be explained due to alignment with countries to WOAH's target year.

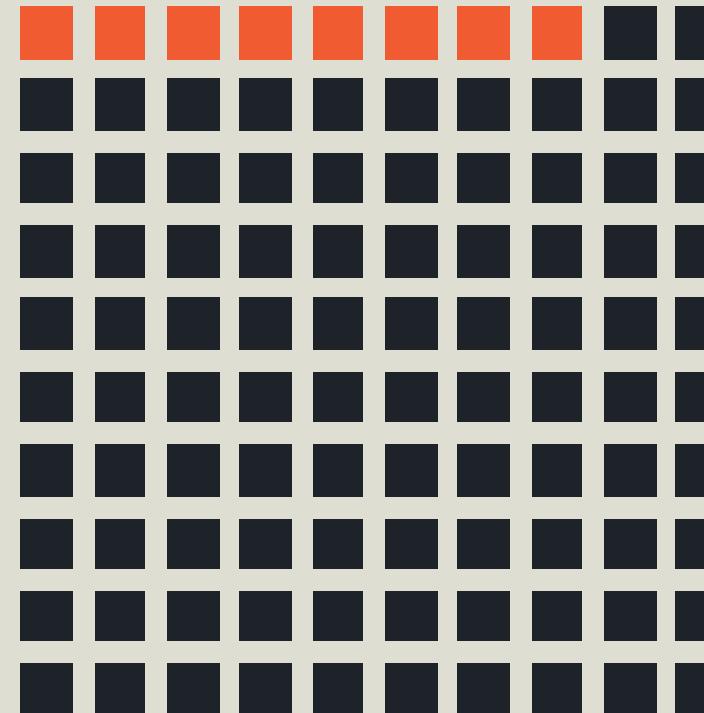

Participation during the 9th round of ANIMUSE

Use of antimicrobials critical to human health

Only **8%** of antimicrobials used in animals in 2022 are considered as highest priority critically important (**HPCIA**) for human health. We must preserve their efficacy by using them in a responsible way.

Importance of antimicrobials to human health

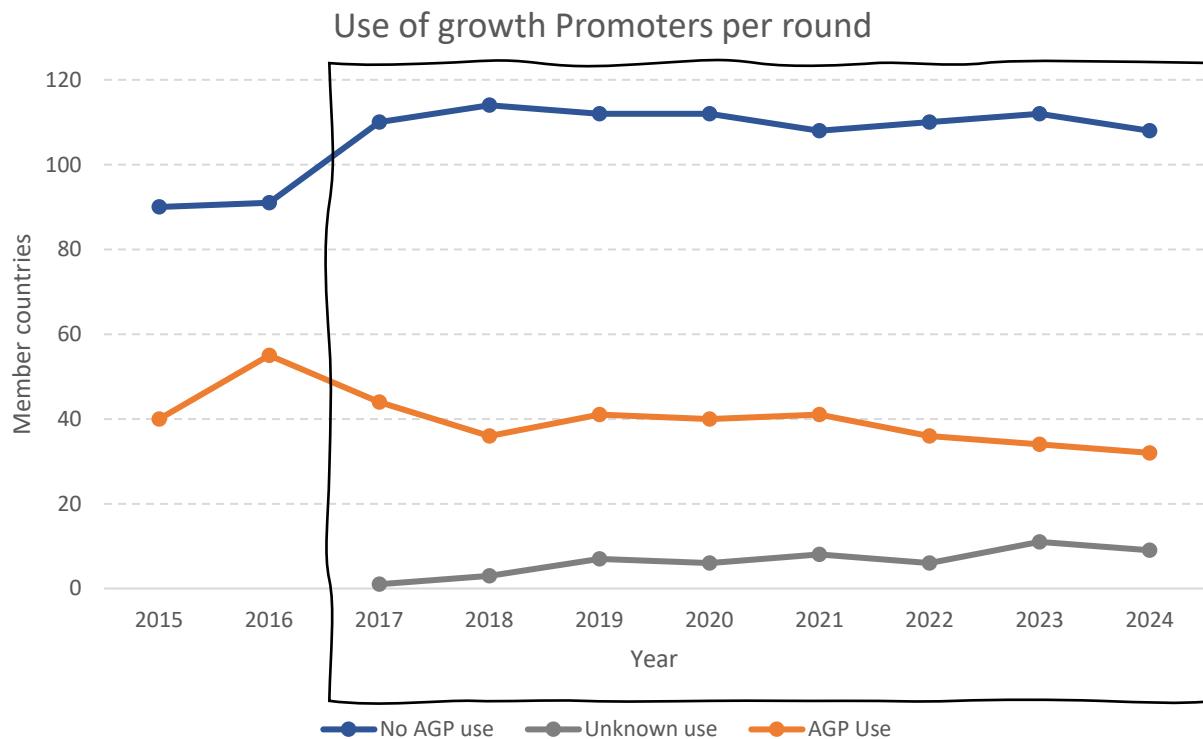

- **HPCIA**
- Others

Use of Growth Promoters (AGPs)

No changes observed in the risk analysis uptake by Members over the past decade to inform the use of growth promoters; at global level only three countries have a risk analysis for the use of growth promoters.

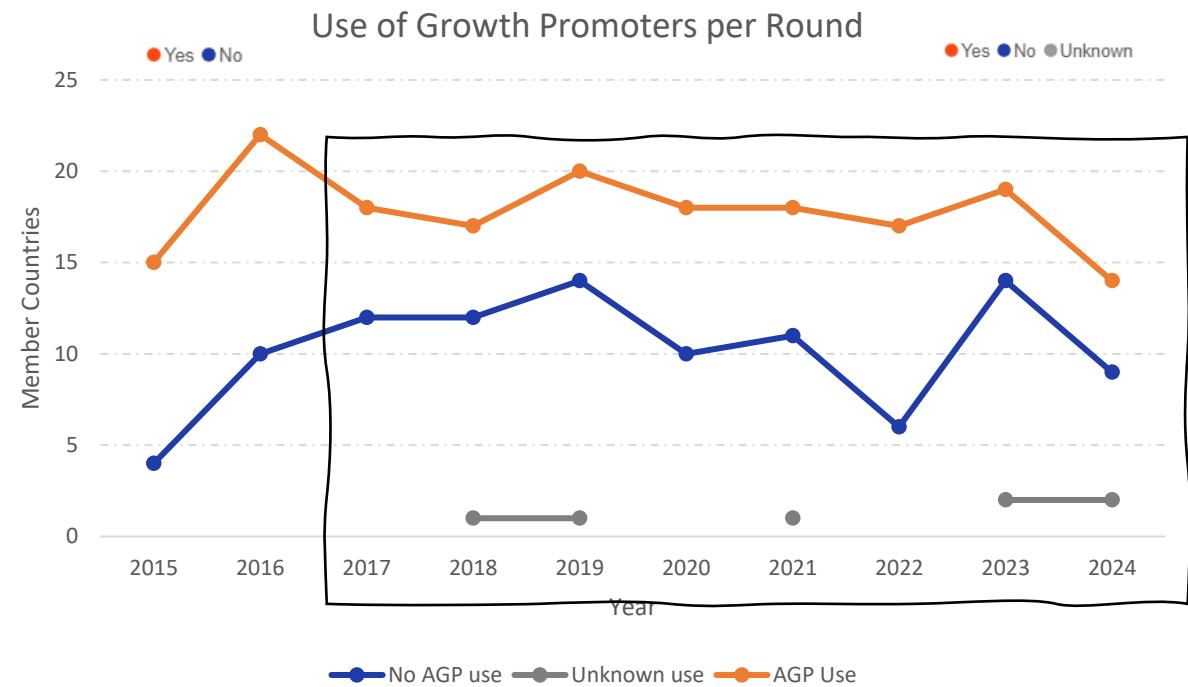

Global

2017

Americas

For the first time, antimicrobial quantities normalised by estimated animal biomass were compared between terrestrial and aquatic food-producing animals by antimicrobial classes.

Terrestrial food-producing animals

47% covered by AMU data

98
milligrams

of antimicrobials adjusted by
kilograms of animal biomass

Aquatic food-producing animals

64% covered by AMU data

21 milligrams

of antimicrobials adjusted by
kilograms of animal biomass

Trends on time (2020 2022)

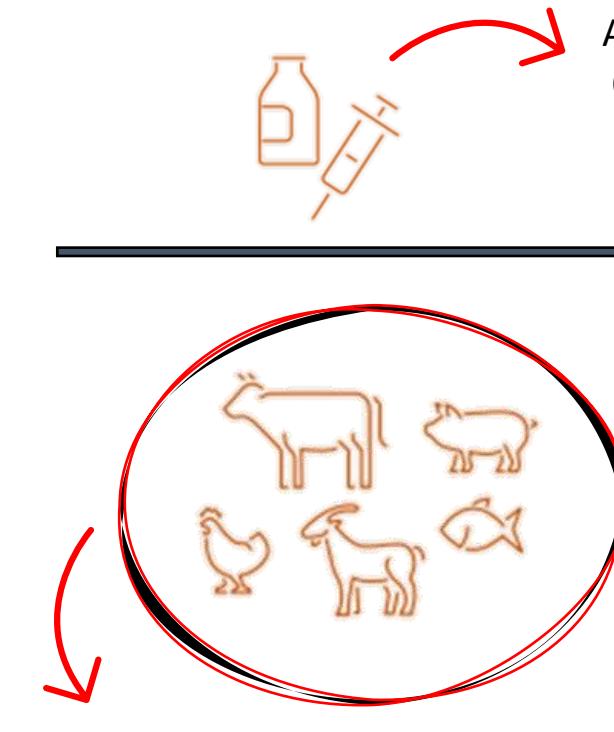

Antimicrobial use is expressed in mg/kg of animal biomass. It is determined by adjusting the quantity of antimicrobial agents reported (mg) by the live domestic animal biomass (kg) each year. This indicator can be compared between regions and over time.

Antimicrobial agents (**mg**)

Animal biomass (**kg**)

Calculated Animal Biomass of a country for the target year

As **reported** by the country to the OIE data collection for the target year

Reporting Option 4

Reporting Option 4

Reporting Option will stratify data by animal species (launch by Sept. 2026). During the first weeks of Sept. 2025, 18 Members were invited to provide written feedback to WOAH. Of them, only 9 came back with their feedback as follows:

- Five only expressed that it will not be possible to provide such data by September 2026. Two of them will approach to the private sector to strengthen the collaboration.
- One understood WOAH is requesting all Members to collect farm level data.
- Three provided written feedback on how to improve the documents.

Animal Species	Guidance
Non-food-producing animals	
Canines and felines	Includes cats and dogs.
Other non-food-producing animals	Includes all other non-food-producing animals not previously listed, including ornamental fish, horses, etc.
Terrestrial food-producing animals	
Bovines	Includes calves, dairy cattle, beef cattle and buffaloes (excluding Syncerus caffer).
Pigs	Includes piglets, fattening pigs, breeding pigs and backyard pigs.
Sheep and goats	Includes lambs, kids, adult sheep and adult goats.
Poultry	Includes broiler chickens, layer chickens, turkey, backyard poultry and other commercial poultry.
Equidae	Includes horses, donkeys and their crosses.
Other terrestrial food-producing animals	Includes all other terrestrial food-producing animals not previously listed, including rabbits, reptiles, bees (e.g. honey), Camelidae, Cervidae, etc.
Aquatic food-producing animals	
Fish – Undefined	Include amount of antimicrobials that could not be stratified by types of fish – (i.e., cannot distinguish between fish – Freshwater, fish – Salmonidae or Fish – Marine).
Fish – Freshwater	Includes Cyprinidae (carps, etc.), Cichlidae (tilapia, etc.) and Siluriformes (catfish, etc.).
Fish – Salmonidae	Includes Salmonidae (salmon, trout, etc.).
Fish – Marine	Includes marine fish.
Crustaceans – Penaeidae	Includes marine shrimp/prawn.
Other aquatic food-producing animals	Includes all other aquatic food-producing animals not previously listed, including molluscs and amphibians.
Unknown animals	
Unknown animals	Use this category if specific animal species cannot be determined for a proportion of antimicrobial quantities.

One comment mentioned that we should align animal species internally at WOAH (we already follow WAHIS). Additionally, if possible, to align with InFARM animal species for future data integration.

Variable SPECIES (data model options A and B)	Animal species or food products where samples/isolates were collected
Code	Description
AMP	Amphibians ^{§#}
BEE	Bees [§]
BRO	Broilers – commercial production for meat ^{*§#}
BUF	Buffaloes (not Syncerus caffer) ^{*§#}
CAM	Camelidae [§]
CAN	Dog [§]
CAT	Cattle ^{*§}
CER	Cervidae (farmed) ^{*§#}
CRU	Crustaceans-Penaeids (e.g. shrimp) ^{§#}
DUC	Duck ^{*§}
EQU	Equidae (Horse, Donkey, Mule) ^{*§#}
FCI	Fish-Cichlids (e.g. tilapia) ^{§#}
FCY	Fish-Cyprinids (e.g. carp) ^{§#}
FEL	Cat [§]
FMA	Fish-Marine ^{§#}
FSA	Fish-Salmonids (e.g. salmon, trout) ^{§#}
FSI	Fish-Siluriformes (e.g. catfish) ^{§#}
GOA	Goats ^{*§}
INS	Insect ^{*§}
LAY	Layers – commercial production for eggs ^{*§#}
MOL	Molluscs (e.g. shellfish) ^{§#}
OAA	Other aquatic food-producing animals ^{§#}
OANF	Other aquatic non-food-producing animals [#]
OPO	Other commercial poultry ^{*§}
OTA	Other terrestrial food-producing animals ^{*§}
OTNF	Other terrestrial non-food-producing animals [§]

Variable SPECIES (data model options A and B)	Animal species or food products where samples/isolates were collected
Code	Description
PIB	Pigs-backyard ^{*§}
PIC	Pigs-commercial ^{*§}
POB	Poultry – backyard ^{*§}
PROA	Animal processed food products [§]
PROP	Plant food products [§]
RAB	Rabbits ^{*§}
REP	Reptiles (e.g. crocodiles) ^{§#}
SHE	Sheep ^{*§}
SHG	Sheep and goats (mixed flocks) ^{*§}
TUR	Turkey ^{*§}
O	Others
UNK	Unknown

Other Antimicrobials

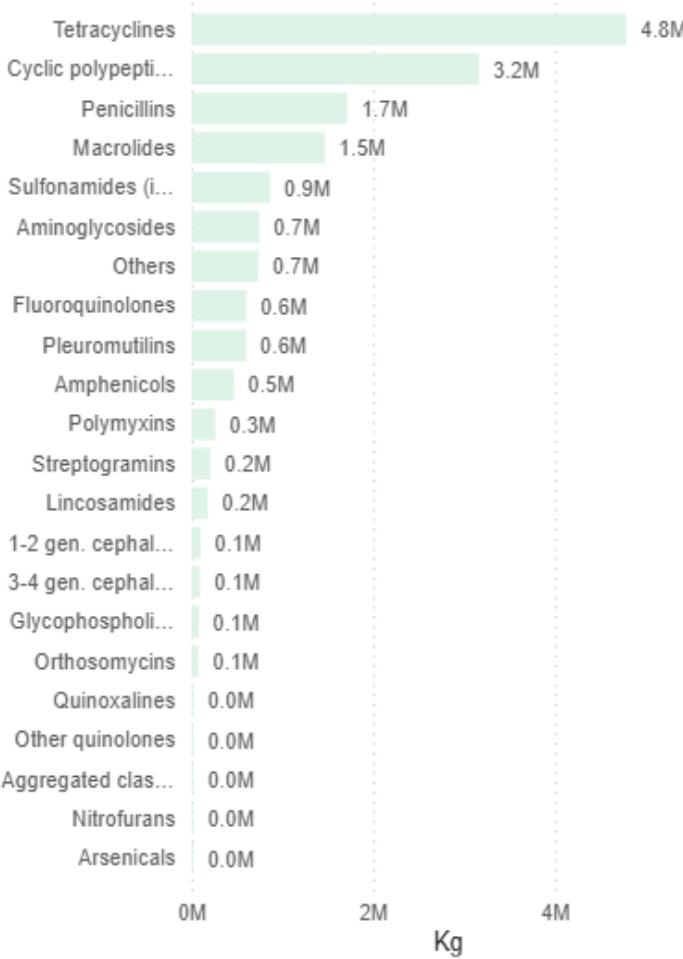

Addition of other antimicrobials

Draft zero of the Global Action Plan on AMR (2026 – 2035) indicates the following:

AMR surveillance should systematically include bacterial, fungal, parasitic and viral resistance, supported by reliable microbiology, epidemiology, and economic data analysis capacity consistent with national context. **These systems should monitor both AMR and AMU, and integrate data on behavioral, socioeconomic, and environmental determinants of AMR to deepen current understanding of AMR drivers and population-level trends...**

2024 UN Political Declaration on AMR: Key takeaways for Veterinary Services

For the second time in history, UN Member States have adopted a [Political Declaration](#) on antimicrobial resistance (AMR). During the 79th United Nations General Assembly in September 2024, they reached consensus on 44 commitments. Almost half of them consider animal health matters, including four setting specific goals for our sector. Such recognition marks a significant milestone of our efforts to contain AMR.

This memo summarises the key outcomes that Veterinary Services need to consider and implement as their essential contributions to ensure that this global effort translates into successful achievements.

- 1. PREVENTION**
- 2. RESOURCED SURVEILLANCE**
- 3. CROSS SECTORAL COORDINATION**
- 4. SUSTAINABLE FUNDING**

Did you receive this? Have you used it? ²⁰

Four commitments for the animal health sector by 2030

As a member of the national Veterinary Services, your work plays a central role in ensuring their achievement.

Reduced quantities of antimicrobials used in animals

69. 'Strive to meaningfully reduce [...] the quantity of antimicrobials used globally in the agri-food system [...] taking into account the [...] standards, guidance and recommendations of the World Organisation for Animal Health.'

Prudent and responsible use of antimicrobials in animals

70. 'Commit to ensure that the use of antimicrobials in animals and agriculture is done in a prudent and responsible manner in line with [...] the standards, guidance and recommendations of the World Organisation for Animal Health.'

Prioritisation of prevention with a focus on animal vaccination strategies

72. 'Ensure [...] that animal vaccination strategies are defined with an implementation plan [...] taking into account WOAH's list of priority diseases for which vaccines could reduce antimicrobial use [...].'

Investment to ensure access to essential veterinary services

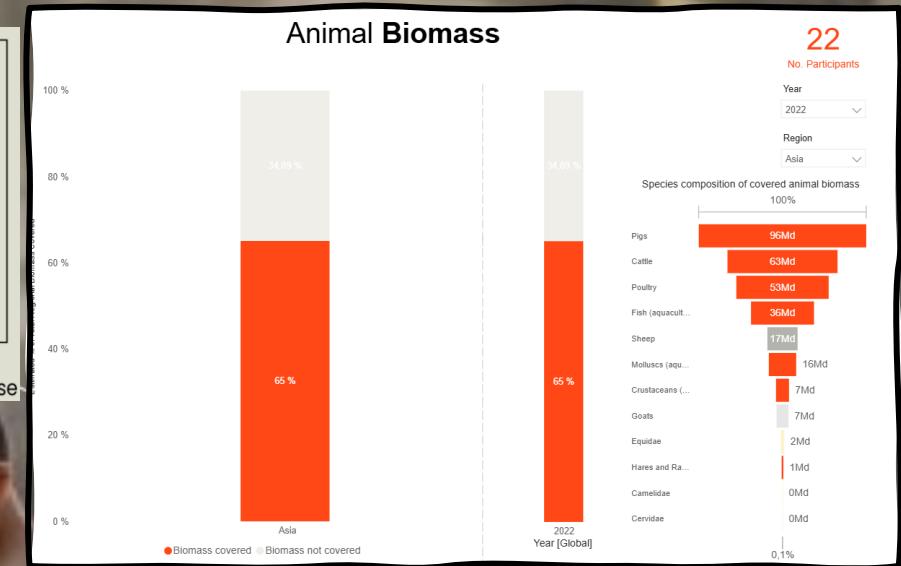

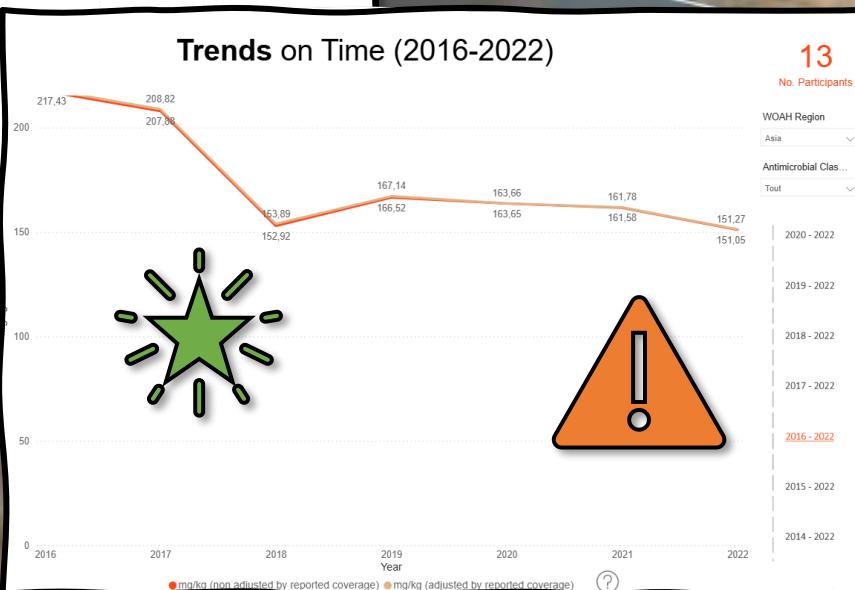

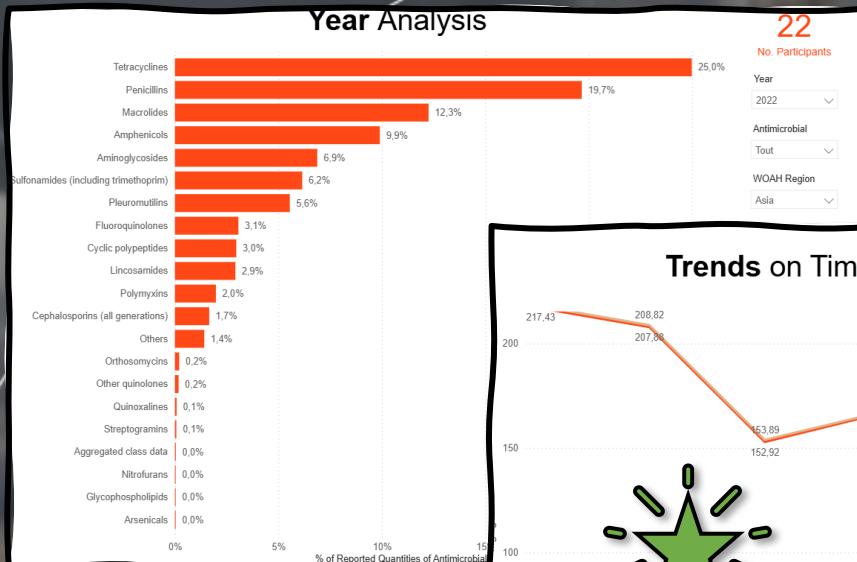

73. 'Invest in animal health systems to support equitable access to essential veterinary services, improve animal health and appropriate management practices to prevent infections [...].'

Reduced quantities of antimicrobials used in animals

69. 'Strive to meaningfully reduce [...] the quantity of antimicrobials used globally in the agri-food system [...] taking into account the [...] standards, guidance and recommendations of the World Organisation for Animal Health.'
